Habitat-level environmental complexity increases co-occurrences between natural and introduced predators in sweet peppers under protected environments with a positive effect on pest regulation

Study system

Annual community's habitat comprised *Tuberarietea guttatae* Br.-Bl. 1952 em. Rivas-Martínez 1978, *Trachynietalia distachyae* Rivas-Martínez 1978, *Trachynion distachyae* (calciphile), *Sedo-Ctenopsion* (gypsophile), and *Omphalodion commutatae* (dolomitic and silico-basiphile), with species in these alliances including *Dactylis hispanica*, *Asphodelus ramosus*, *Anthyllis vulneraria*, *Carlina corymbosa*, *Sedum sediforme*, *Reichardia picroides*, *Phlomis lychnitis*, and *Venula bromoides*.

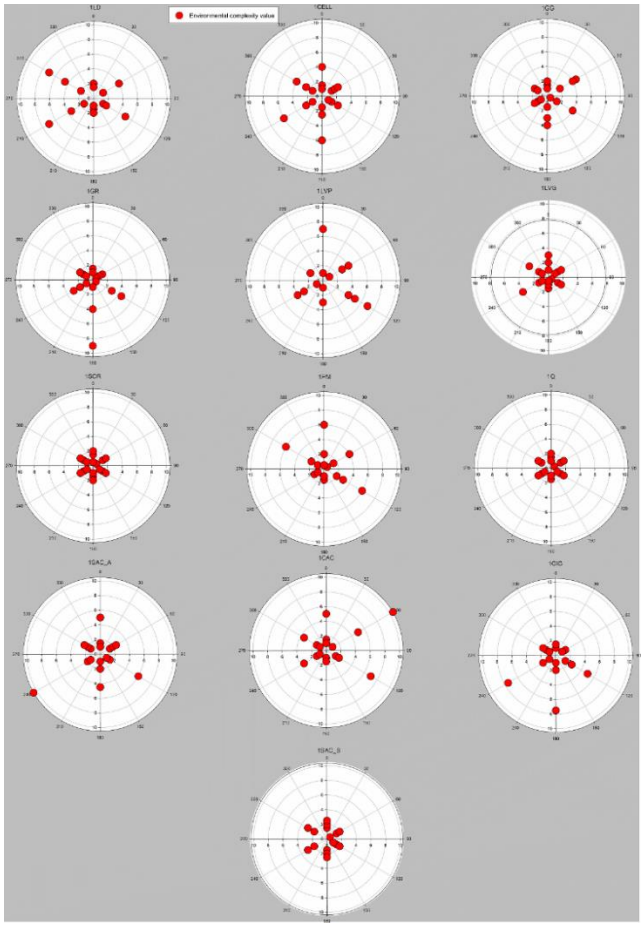

Figure S1. Example for 2020 to calculate the environmental complexity values (ECVs) in the various coordinates analyzed for each site. The ECV values ranged from a minimum of 0.5 to a maximum of 10.5.

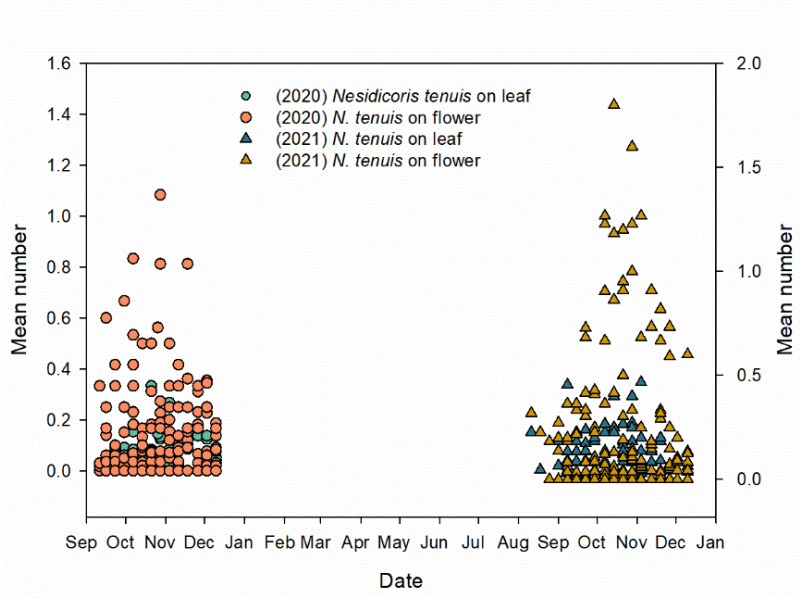

Figure S2. Weekly mean of *Nesidiocoris tenuis* on leaf and flower (2020 left, 2021 right). The figures represent juveniles and adults in leaf or flower.

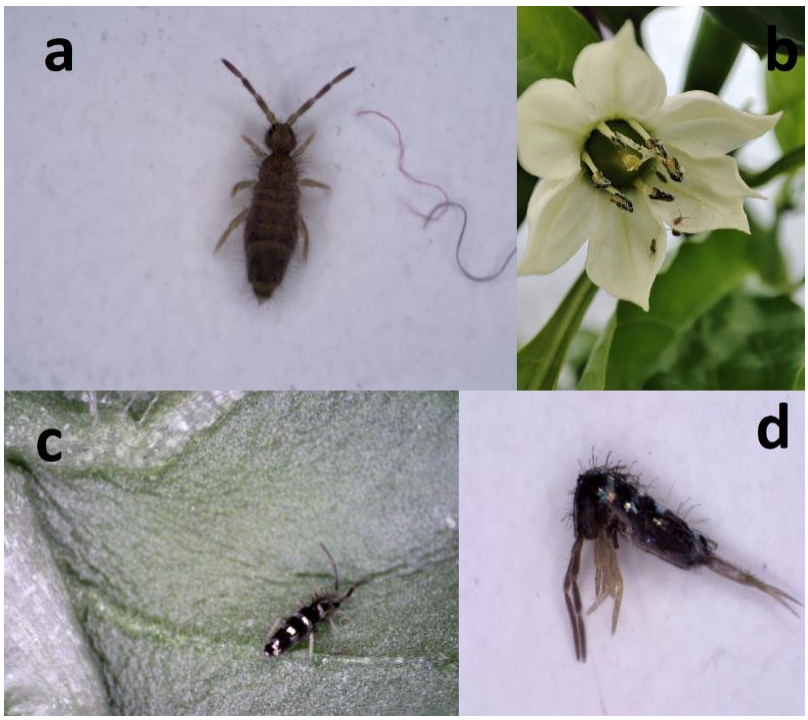

Figure S3. a) Entomobrya sp (Fam. Entomobryidae: Entomobryinae); b) Springtails *Entomobrya* sp. on pepper flower; c) *Seira* sp. (Fam. Entomobryidae: Seirinae); d) Lateral view of *Seira* sp.

Table S1. Means, standard deviation at different sites. *Orius laevigatus*, *Nesidiocoris tenuis*, *Amblyseius swirskii* and WFT at different sites are the total of juveniles and adults for each flower
