ICOMP2021  
2nd International Conference on Theoretical, Analytical and  
Computational Methods for Composite Materials and  
Composite Structures

5-7 March 2021

BOOK OF ABSTRACTS

# Contents

<b>1</b>	<b>Opening</b>	<b>7</b>
	Antonio J. M. Ferreira, Heng Hu (Chairs)	
	Opening . . . . .	7
<b>2</b>	<b>Damage Mechanics</b>	<b>7</b>
	Menghua Zhang, Yuncaoyi Li, Zixuan Pang, Yunxiang Jia, Chenwei Shan	
	Effect of Fiber Orientation on the Machinability of Ultrasonic Assisted Grinding of 2D-C/SiC Ceramic Matrix Composite . . . . .	7
	O.L. Cruz-González, R. Rodríguez-Ramos, F. Lebon	
	On the imperfect interfaces in viscoelastic composite materials . . . . .	7
	Shuxin Li, Qingfeng Duan, Haixiao Hu, Dongfong Cao	
	Damage evolutions and interactions of composite materials and structures under static and cyclic loading . . . . .	8
<b>3</b>	<b>Auxetic materials</b>	<b>10</b>
	Lulu Wei, Xuan Zhao, Guohua Zhu	
	In-plane compression behaviors of the auxetic star honeycomb: Experiment and numerical simulation . . . . .	10
	Shuai Chen, Shaowei Zhu, Bing Wang	
	Bi-material negative stiffness honeycombs for reusable energy trapping . . . . .	10
<b>4</b>	<b>Plates and Shells</b>	<b>11</b>
	Liang Li, Qian Shao, Jie Yang, Heng Hu	
	A data-driven method based on artificial neural network for composite structures	11
	Xiaowei Bai, Jie Yang, Heng Hu	
	A novel data-driven computing algorithm for strong nonlinear response simulation of thin-walled composite structures . . . . .	11
	Wei Yan, Wei Huang, Qun Huang, Jie Yang, Heng Hu	
	Multiscale simulation of composite plates by Structural-Genome-Driven method .	11
	Zengtao Kuang, Qun Huang, Wei Huang, Jie Yang, Heng Hu	
	Numerical simulation of multi-stability in laminated shell structures . . . . .	12
	Armagan Karamanli, Thuc P. Vo	
	Finite element model for carbon nanotube-reinforced and functionally graded multilayer graphene nanoplatelet-reinforced composite beams . . . . .	12
	Redouane Lombarkia, Augustin Gakwaya	
	Numerical Crashworthiness investigations of a Full-Scale Composite Fuselage Section	13
	Jeremy Ryatt, Ramulu Mamidala	
	Prediction of the effective modulus and strength of Tow Based Discontinuous Fiber Composites using meso-scale Finite Element models . . . . .	13
	G.G. Sheng, X.Wang	
	Nonlinear response of functionally graded cylindrical microshells conveying steady viscous fluid . . . . .	14
	M. Najafi and R. Ganesan	
	Rotordynamic Analysis of Tapered Composite Driveshaft Based on the Finite Element Formulation including Shear Deformation Effects . . . . .	14
	C. Delvadiya and R. Ganesan	
	THREE-DIMENSIONAL FREE VIBRATION RESPONSE OF THICK LAMINATED COMPOSITE DISCS . . . . .	15

<a href="#">Gyanesh Patnaik, Anshul Kaushik, A. Rajput, G. Prakash</a>	Influence of projectile shape, stacking sequence, thickness on perforation characteristics of CFRP laminates subjected to impact . . . . .	18
<a href="#">Diane Wowk, Mark Boctor</a>	Effect of impact location on the variation of residual dent depth in metallic honeycomb sandwich panels . . . . .	18
<a href="#">Libin Zhao, Tiancheng Cao, Yu Gong, Jianyu Zhang</a>	Research on delamination behavior of multidirectional composite laminates under static loading . . . . .	19
<a href="#">Chao Zhang</a>	Impact simulation of textile composites: from meso-scale model to multi-scale model	19
<a href="#">Maxime Merle, Marco Gigliotti, Jean-Claude Grandidier, William Egea</a>	Numerical development of a discrete semi-continuous element to model laminated and woven composite behavior during impact loadings . . . . .	20
<a href="#">Jinming Li, Liu Liu</a>	Dynamic Analysis of Metallic Integrated Thermal Protection Systems using Variational Asymptotic Method with General Boundary Conditions in Thermal Environments . . . . .	21
<a href="#">R. Augello, E. Carrera, A. Pagani, D. Scano</a>	Mixing layer-wise and refined equivalent-single layer FEs based on Lagrange expansions . . . . .	22

<b>5</b>	<b>Materials</b>	<b>30</b>

Artūras Kilikevičius, Jurgita Malaiškienė, Rimvydas Stonys, Jonas Matijošius, Kristina Kilikevičienė	
Dynamic Measurements for Determining Mechanical Properties of MCC type Refractory Castable with Graphene Oxide . . . . .	30
Jing Ban, Song Yao, Yanni Rao	
A multi-scale prediction model for longitudinal tensile strength of fuzzy fiber reinforced polymers . . . . .	32
Monika Pracht, Waldemar Swiderski	
Analysis of the influence of the structure of composites reinforced with aramid fibres on the detection of defects by IR thermography methods. . . . .	32
S. Tinkloh, T. Wu, T. Troester, T. Niendorf	
Development of a submodel technique for FFT-based solvers in micromechanical analysis . . . . .	32
N.A. Gudkov, S.V. Lomov, I.S. Akhatov, S.G. Abaimov	
The sensitivity of computational electrical response in CNT-polymer self-diagnostic nanocomposites to input model parameters . . . . .	33
K. LAOUBI, S. CHALAL	
Study of the mechanical properties of a LDPE composite based on a modified ceramic charge . . . . .	34
Melih Soner ÇELİKTAŞ, Merve UYAN	
Shape Memory Polymer Composites: Stimuli methods, Application areas, Challenges and Opportunities . . . . .	35
Edwin Gevorkyan, Mirosław Rucki, Vladimir Chishkala, Wojciech Żurowski, Wojciech Kucharczyk, Voskan Barsamyan	
Analysis of the electroconsolidation of fine-dispersed structures out of Al <sub>2</sub> O <sub>3</sub> -WC nanopowders . . . . .	35
A. A. Pisano, P. Fuschi	
Human femur: evaluation of mechanical strength by limit analysis . . . . .	36
Dileep Bonthu, Bharath H S, and Mrityunjay Doddamani	
Additively Manufactured Foam under Compression . . . . .	37
Yang Yang, Fei Wang	
Rotational 3D Printing of Carbon Fiber Reinforced Epoxy Composites with Controllable Fiber Orientation . . . . .	37
Anita Zade, Swati Neogi, Raghu Raja Pandiyan Kuppusamy	
Optimization of Thermal Profile for Automotive Composite Part using Non-Isothermal RTM Cure Simulation . . . . .	38
Miguel Marco, Ricardo Belda, María Henar Miguélez, Eugenio Giner	
Numerical analysis of mechanical behaviour of lattice and porous structures . . . . .	39
Miguel Marco, Eugenio Giner, María Henar Miguélez, David González	
On the effect of geometrical fibre arrangement on damage initiation in CFRPs under transverse tension and compression . . . . .	39
Van-Tho Hoang, Ga-Young Ahn, Kang-Sun Yoon, Jin-Hwe Kweon1, and Young-Woo Nam	
A novel design concept for radar absorbing structures and lightning strike protection using Nickel-coated glass/epoxy composites . . . . .	40
Adrian Chajec, Sławomir Czarnecki, Seweryn Malazdrewicz, Lukasz Sadowski	
The prediction of abrasion resistance of mortars modified with granite powder and fly ash using artificial neural networks . . . . .	40

	<a href="#">Adrian Chajec, Lukasz Sadowski</a>	
	Modeling of Bleeding of Cement Pastes Modified with the Addition of Granite Powder . . . . .	42
	<a href="#">Periyasamy.P, Vetere Selvan.E, Naveen.E, Ramanan.N, Bhavani.K, Sethu Velappan</a>	
	DETERMINATION OF MECHANICAL PROPERTIES OF CFRP COMPOSITE REINFORCED WITH ABACA AND KENAF FIBERS . . . . .	44
	<a href="#">Alexander Vedernikov, Fausto Tucci, Pierpaolo Carlone, Iskander Akhatov, Alexander Safonov</a>	
	Modelling spring-in distortions of L-shaped structural profiles pultruded at different pulling speeds. . . . .	44
	<a href="#">Kamil Krzywiński, Lukasz Sadowski</a>	
	The durability of polymer-cementitious floor composite made of epoxy resin modified with recycled fine aggregate and concrete substrate . . . . .	45
<b>6</b>	<b>Optimization</b>	<b>46</b>
	<a href="#">Ajeesh Suresh Nair and Rajamohan Ganesan</a>	
	Optimization for FPF Strength of tapered composite tubes subjected to combined axial and torsional loadings based on genetic algorithm . . . . .	46
	<a href="#">Yuhang Huo, Ye Tian, Shiming Pu, Tielin Shi, Qi Xia</a>	
	Continuous fiber angle optimization method . . . . .	46
<b>7</b>	<b>Functionally graded materials and structures</b>	<b>48</b>
	<a href="#">Boris I. Mitrin, Polina A. Lapina, Vladimir B. Zelentsov, Sergei M. Aizikovich</a>	
	Mathematical model of wear of two-layered coating on elastic substrate . . . . .	48
	<a href="#">Andrey S. Vasiliev, Sergei Aizikovich, Sergei S. Volkov</a>	
	Approximated analytical expressions for displacements of the surface of an FGM-coated half-space under thermal and electric loading . . . . .	48
	<a href="#">Sergei Aizikovich, Andrey S. Vasiliev, Evgeniy V. Sadyrin</a>	
	Theoretically-experimental study on nanoindentation of coated solids . . . . .	48
	<a href="#">E.V. Sadyrin, D.V. Yogina, B.I. Mitrin, A.S. Vasiliev, A.L. Nikolaev, S.M. Aizikovich, S.Yu. Maksyukov</a>	
	Efficacy of in vitro restoration of mechanical properties and mineral density of carious enamel: infiltration, sealing with composite and glass ionomer cement . . . . .	49
<b>8</b>	<b>Concrete-FRP</b>	<b>51</b>
	<a href="#">Xiaoyong Zhang, Zhan Guo, Yu Chen</a>	
	Behavior of concrete filled GFRP tubular columns with inner various section shapes of GFRP . . . . .	51
	<a href="#">Slawomir Czarnecki</a>	
	THE INFLUENCE OF THE TYPE OF THE FORMWORK ON THE AS-CAST CONCRETE SURFACE MORPHOLOGY . . . . .	51
	<a href="#">J. Szymanowski, Lukasz Sadowski</a>	
	Analysis of influence of selected nanoadditives on mechanical performance of high-strength layered cementitious composite in concrete floors. . . . .	52
	<a href="#">Heeyoung Lee, Sanghyeon Cho, Wonseok Chung</a>	
	Applicability of Prestressed Near Surface Mounted CFRP Bar System according to Condition of Reinforced Concrete Beam . . . . .	52

	Farid Abed, Mohamad Kusay Sabbagh and Abdul Saboor Karzad	
	Shear Analysis of basalt fiber-reinforced concrete deep beams reinforced longitudinally with BFRP bars using Strut-and-Tie Modeling . . . . .	53
	Xiaoyong Zhang, Yu Chen, Mengya Ye	
	Research on square concrete filled GFRP tube columns strengthened with CFRP sheet . . . . .	53
<b>9</b>	<b>Joints</b>	<b>55</b>
	Lin Minxiao, Guo Shijun, Jafar Jamshidi	
	Damage monitoring of adhesive-bonded composite T-joint by the embedded smart composite fasteners . . . . .	55
	Agnieszka Chowaniec, Sławomir Czarnecki, Lukasz Sadowski	
	THE CHEMICAL AND MICROSTRUCTURAL ANALYSIS OF THE ADHESIVE PROPERTIES OF EPOXY RESIN COATING MODIFIED WITH WASTE QUARTZ POWDER . . . . .	55
	J.M.M. Dionísio, L.D.C. Ramalho, R.D.S.G. Campilho, Jorge Belinha, I.J. Sánchez-Arce, D.C. Gonçalves	
	Analysis of the stress singularity in composite adhesive joints . . . . .	56
<b>10</b>	<b>Thermal problems on Composite Structures</b>	<b>57</b>
	Paweł Czapski	
	Influence of manufacturing technique on buckling and post-buckling behaviour of thin-walled, composite channel-section columns – experimental and numerical studies . . . . .	57

	A Novel Semi-analytical Approach for Thermal Properties of Fuzzy Fiber Reinforced Composites . . . . .	57

heating rate up to 500 °C/min, the grain growth was limited that resulted with enhanced mechanical properties of the obtained bulk material. The grains in the obtained bulk material were 500-700 nm, 5-6 times larger than the particles in the initial nanopowder. However, electroconsolidation at rates 250 °C/min and 50 °C/min resulted with respective grains 30-40 and 60-90 times larger than the powder particles. It is difficult to identify proper mechanisms of the consolidation even in a typical sintering processes despite they are examined for decades. Quick sintering at high heating rates poses additional theoretical problems, since vacancies flow is reduced, large pores are decreased, and grain growth is slowed down. When the porosity at the grain boundaries is quickly decreased, mobility in this area rapidly intensifies. Thus, high rate heating generates two opposite mechanisms. On the one hand, large number of small pores appears, and in the other hand, they provide conditions for the grain growth. The pores become the interference at the grain boundaries and thus grains tend to grow more intensely. During the heating under pressure, physical contact between grains leads to the formation of branched network of boundaries. The free surface energy is consumed by the boundaries formation, while the excessive energy is the main motor of sintering. High heating rate activates the sliding effect along grain boundaries leading to quick densification. Moreover, sintering mechanism is additionally powered by the energy of lattice imperfections, which in case of plasmochemically synthesized nanopowders is substantial. Due to the stresses in the necks of the sintered particles and gradient of vacancies concentration, diffusional displacement of the mass towards necks takes place. Methods for calculation of densification considering volumetric diffusion, as well as diffusion in boundaries and surfaces, allowed determination of the diffusion coefficients based on the experimental data. The results confirmed suggestion that the nanoparticles contained substantial amounts of linear imperfections and dislocations appeared in the contact area between the particles during sintering process under the electrical current and mechanical pressure.

#### **Human femur: evaluation of mechanical strength by limit analysis**

A. A. Pisano, P. Fuschi

University Mediterranea of Reggio Calabria, Via dell'Università 25, I-89124 Reggio Calabria, Italy

Population aging, especially in the more developed Countries, is an indicator of well-being, nevertheless it poses a number of problems such as, among other, the increasing of bone-related diseases, skeletal fractures and osteoporosis, which affect the health system and have significant economic implications. In the last few decades, several scientific efforts have been made to predict and describe the human bones mechanical behaviour under different loading conditions, see e.g. [1] and references therein. However, the complexity of the bone material depending, in contrast to engineering materials, by several external factors such as age, conditions of growth, type of feeding, environmental and working circumstances, has not allowed scientists to find approaches of general applicability, so that the research in this area is very active. Finding motivation on the above remarks, the present contribution proposes the application, in the above outlined context, of the Limit Analysis Theory, so focusing on the ultimate bone mechanical conditions. A sufficiently accurate and reliable prediction of the peak/collapse load for a human long bone is attained. In particular, a Finite Element (FE) numerical technique, namely the Elastic Compensation Method (ECM), is promoted to address the human femur limit analysis. The ECM is an iterative procedure made of sequences of linear elastic analyses, through which the elastic moduli of the constituent material are systematically varied to simulate the process of stress redistribution arising within the structure suffering an increasing load till the attainment of its strength threshold. The ECM has been applied by the authors in the past to structures made of engineering materials like steel, composites or reinforced concrete [2]. To deal with human bone material, a constitutive model of Tsai-Wu-type in principal stress space is assumed for the human bone [3], the latter is modelled in 3D and viewed, at a macroscopic level, as a structural element made of a composite anisotropic material. The obtained numerical results, even if at an early

stage, when compared with the ones present in literature and obtained via experimental findings, [4], encourage the authors to continue the undertaken research.

In current work syntactic foam-based functionally graded material (FGM) is developed using fused filament fabrication (FFF). FGM is printed using lightweight filaments of glass micro balloon (GMB) reinforced high-density polyethylene (HDPE). Flat wise compressive behavior of 3D printed HDPE and syntactic foam-based FGM (0-20-40) are studied as per ASTM standard. Results reveal that the compressive modulus of the FGM is higher compared to neat HDPE with a slight decrease in strength. This is due to induced void content formed during the 3D printing. These voids enhance the weight reduction potential of the foams and help in improving damping and buoyancy properties. The specific modulus and strength of 3D printed FGM are higher compared to neat HDPE. Results of SEM analysis showed that sustainability of filler was good in pre-compression tested samples without any GMB failure which signifies that all the chosen process parameters for printing FGM are appropriate, whereas breakage of GMB filler is observed in post-tested samples.

Keywords: 3D printing; Syntactic foam; Glass micro balloons; Functionally graded material.

#### **Rotational 3D Printing of Carbon Fiber Reinforced Epoxy Composites with Controllable Fiber Orientation**

[Yang Yang, (Fujian Key Laboratory of Special Energy Manufacturing, Huaqiao University, Xiamen 361021, China)

(Xiamen Key Laboratory of Digital Vision Measurement Huaqiao University, Xiamen 361021, China), 15165205179@163.com] [Fei Wang, (Fujian Key Laboratory of Special Energy Manufacturing, Huaqiao University, Xiamen 361021, China)

(Xiamen Key Laboratory of Digital Vision Measurement Huaqiao University, Xiamen 361021, China), wangfei@hqu.edu.cn]

Carbon fiber reinforced epoxy resin composites play a vital role in application of aerospace, traffic vehicle and lightweight engineering. The composites exhibit exceptional mechanical performance that often arises from complex fiber orientation in the material. Controlling fiber orientation in materials is very challenging. A set of rotary extrusion 3D printing equipment was built to change fiber orientation. Using this equipment, orientation of short fibers in the printing trajectory can be
